

# Whale Identification Project

## Using photographs to identify Southern Right Whales

The South East Australian Southern Right Whale Photo-identification Project is assisting DELWP and other government agencies to improve their understanding of the Southern Right Whale (*Eubalaena australis*) population within south-east Australia.

Collecting and comparing photographs of whale markings helps us to identify individual whales and monitor the population that visits the Victorian coast each winter.

### Why is population assessment important?

Accurate population assessment is essential to understand the status of the Southern Right Whale in south-east Australia. This helps DELWP evaluate and manage the impacts of human-induced threats such as entanglement, vessel collision and acoustic disturbance.

### How are individual whales identified?

Individual Southern Right Whales can be identified by unique patterns of thickened skin on the head (known as callosities). The callosities used for photo-identification include the bonnet, lip patches, rostral islands, coaming and post-blowhole island (shown in Figure 1).

Identification of individual Southern Right Whales relies on obtaining clear images of the callosity pattern on the rostrum area (upper jaw or snout) on top of the head. The images are most effective when captured from a cliff-top or some other high vantage point on the land such as a lighthouse. Best images from land are of whales breaching (Figure 2) or spyhopping (Figure 3, top). However, multiple images of the same whale taken from different angles can help capture all callosity features required for identification (Figure 3a – 3b)

## How can I contribute?

DELWP are looking for members of the whale watching community to submit images of Southern Right Whales to the database. Your images will help us track individual whales and monitor the population.

Photos can be uploaded via:

<http://www.swifft.net.au/srwsmp>

You will need to register an account to start uploading photos and sighting data. As a registered user you will receive updates about the whales and our research.

As a minimum, please provide the date, time and location of your sighting as well as your best contact details. Other useful information includes: the number of whales in the pod, if a calf was present and any behaviours that you may have noted.

## What happens to the data?

Photographs of whale callosity patterns are stored in a database (SEA SRW PIC). Comparisons between images within this catalogue are made to identify individual movements and breeding patterns and to determine trends in population size and distribution. Summaries of our research findings will be available on the SWIFFT website (see link above).
